

SCA Salesforce Connector

The **SCA Salesforce Connector** is a secure, "Zero-Trust" Azure Function App that bridges Salesforce CRM and the **Secure Contacts App (SCA)**. It automates the retrieval, encryption, and storage of Salesforce contacts, making them available to SCA users without requiring additional Salesforce licenses.

For full documentation (including a detailed setup guide), refer to the documentation included in the connector ZIP package.

Who is it for?

Organizations using Salesforce as a CRM who want to securely extend contact data to SCA users - without compromising on security or compliance.

Key Value Propositions

- **Cost Efficiency:** Provides access to Salesforce contacts without needing a "Full User" license for every employee.
- **Hardened Security:** Features **AES-256 encryption**, tenant-specific isolation, and a passwordless architecture (OAuth 2.0 JWT & Managed Identities).
- **Automated Sync:** Keeps contact data fresh via scheduled or manual triggers.
- **Easy Configuration:** Dynamically generates the required AppConfig JSON for MDM deployment.

High-Level Architecture

1. **Trigger:** Azure Function fires (Timer or HTTP).
2. **Fetch:** Authenticates to Salesforce via Certificate-based JWT.
3. **Secure:** Encrypted contact data remains protected throughout its lifecycle.
4. **Store:** Uploads encrypted JSON blobs to a private Azure Storage container.
5. **Access:** SCA retrieves and decrypts the data locally on authorized devices.

Core Requirements

- **Azure Subscription:** Required for Hosting (Function App), Storage, and Secret Management (Key Vault).
- **Salesforce Account:** Required with API access (System Admin or dedicated API User) to establish the OAuth 2.0 JWT Bearer Flow.

Get started in minutes

Provision in Azure, connect to Salesforce, and configure with just a few environment variables. Enjoy peace of mind with robust encryption, centralized secret management, and automated updates.
